High Dynamic Range Images

- Large ratio between brightest and darkest intensities in the image.
- Small magnitude, local variations in intensity are present across the entire range:

High Dynamic Range Images

Where do they come from?

- Physically-based illumination simulations.
- Digital photography:
 - Combining several differently exposed LDR images into a single HDR image (Debevec & Malik 1997).
 - HDR panoramic video mosaics (Schechner & Nayar 2001).
 - HDR digital cameras.

Goal

- Compression of dynamic range to enable rendering HDR images on LDR devices.
- Desirable features:
 - Avoid large over/under exposed regions.
 - Preserve visibility of fine details (local contrasts).
 - Avoid introducing artifacts to the image.

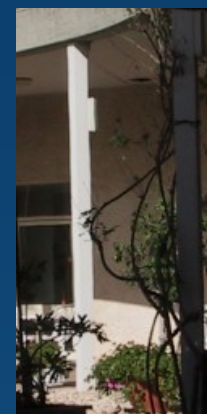

Previous Work

- Spatially invariant tone mapping operators
 - Image-independent curves:
 - Linear scaling, Gamma correction, logarithmic mappings...
 - Image-dependent curves:
 - Histogram equalization
 - Visibility matching tone reproduction (Ward et al. 97)
- Problem: monotonic mapping leads to loss of local contrast!

Example: Ward et al 1997

Previous Work

- Spatially variant tone mapping operators
 - Homomorphic filtering (Stockham 72, Horn 74).
 - Retinex-based operators (Jobson et al. 97)
 - Adaptive histogram equalization (Pizer et al. 87)
 - Multi-scale operators (Pattanaik et al. 98)
- Problem: “halo” artifacts

Example: multi-scale operator

Previous Work

- LCIS – Low Curvature Image Simplifier (Tumblin & Turk 99)
 - Drastic range compression
 - Preservation of visible detail
- Problems:
 - Slow
 - Weak halos, detail over-emphasis

Example: LCIS

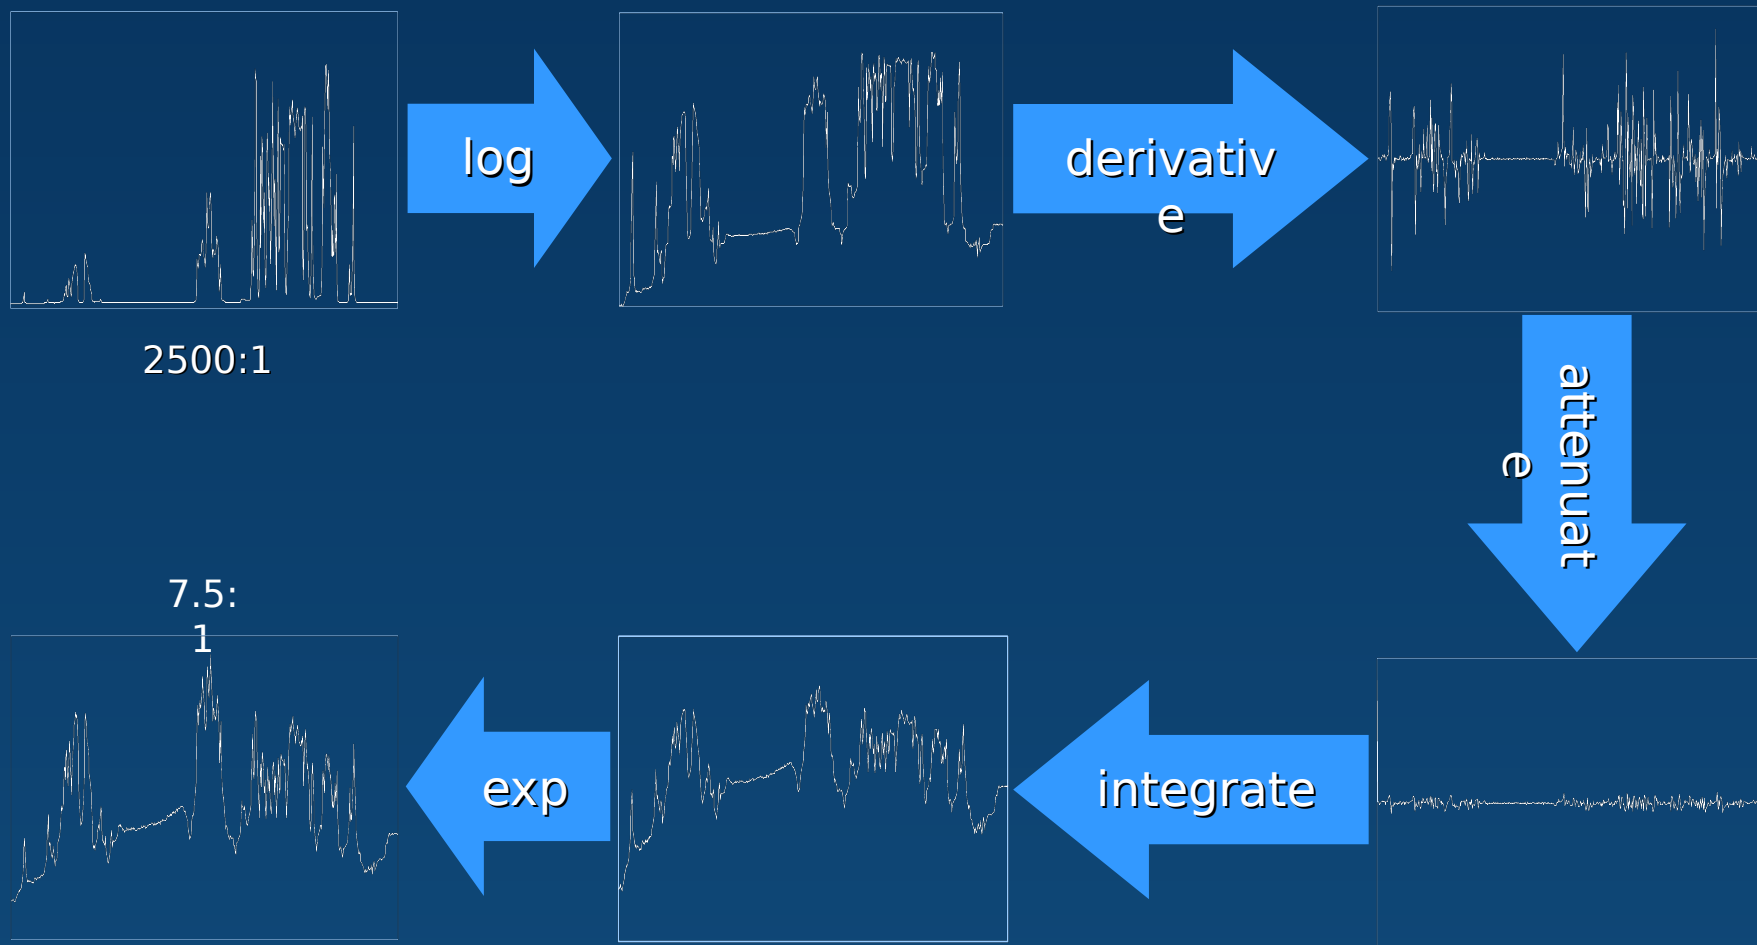

Our Approach - Overview

- Observations:
 - High dynamic range results from strong luminance changes
 - Absolute change magnitude is not important
- Method:
 - Examine gradients to identify luminance changes
 - Attenuate high luminance gradients
 - Reconstruct a low-dynamic range image

The Method in 1D

The Method in 2D

- Given: a log-luminance image $H(x,y)$
- Compute an *attenuation map* $\mathbb{F}(\|\tilde{N}H\|)$
- Compute an attenuated gradient field G :

$$G(x,y) = \tilde{N}H(x,y) \mathbb{F}(\|\tilde{N}H\|)$$

- Problem: G is not integrable!

Solution

- Look for image I with gradient closest to G in the least squares sense.
- I minimizes the integral $\iint_{\Omega} F(\nabla I, G) dx dy$

$$F(\nabla I, G) = \|\nabla I - G\|^2 = \left\| \begin{bmatrix} \frac{\partial I}{\partial x} \\ \frac{\partial I}{\partial y} \end{bmatrix} - \begin{bmatrix} G_x \\ G_y \end{bmatrix} \right\|^2 = \left\| \begin{bmatrix} \frac{\partial I}{\partial x} - G_x \\ \frac{\partial I}{\partial y} - G_y \end{bmatrix} \right\|^2$$

Euler-Lagrange Equation

- I must satisfy:
$$\frac{\partial F}{\partial I} - \frac{d}{dx} \frac{\partial F}{\partial I_x} - \frac{d}{dy} \frac{\partial F}{\partial I_y} = 0$$

- Substituting F we get:

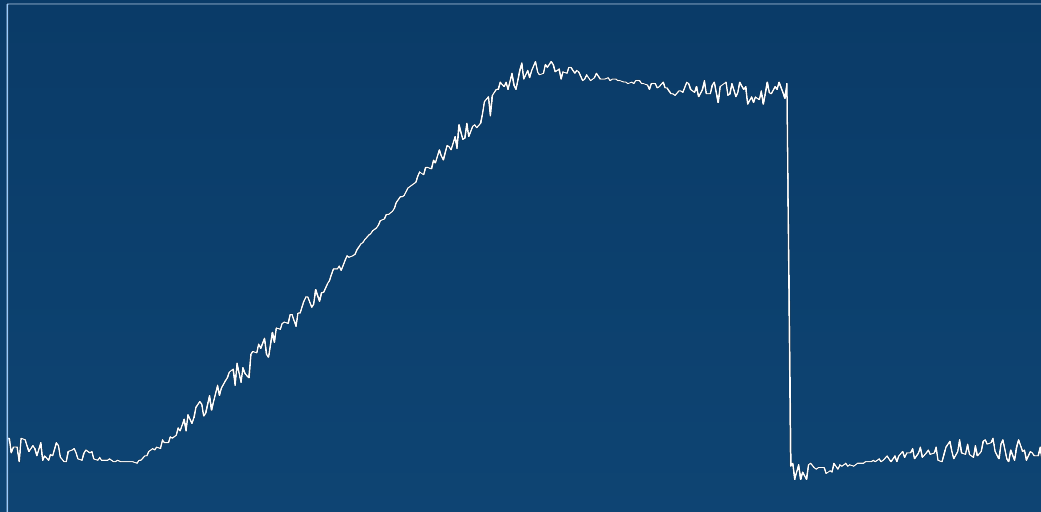

$$2 \left[\frac{\partial^2 I}{\partial x^2} + \frac{\partial G_x^2 I}{\partial y^2} \right] = 2 \left[\frac{\partial G_x^2 I}{\partial y^2} + \frac{\partial G_{yy}}{\partial y} \right] = 0$$

$$\nabla^2 I = \text{div} G$$

Gradient Attenuation

- Strong luminance changes may occur at different rates:

- Must examine gradients at multiple scales!

Performance

- Measured on 1.8 GHz Pentium 4:

- 512 x 384: 1.1 sec
- 1024 x 768: 4.5 sec

- Can be accelerated using processor-optimized libraries.

Results (Ward et al. 1997)

Results (LCIS)

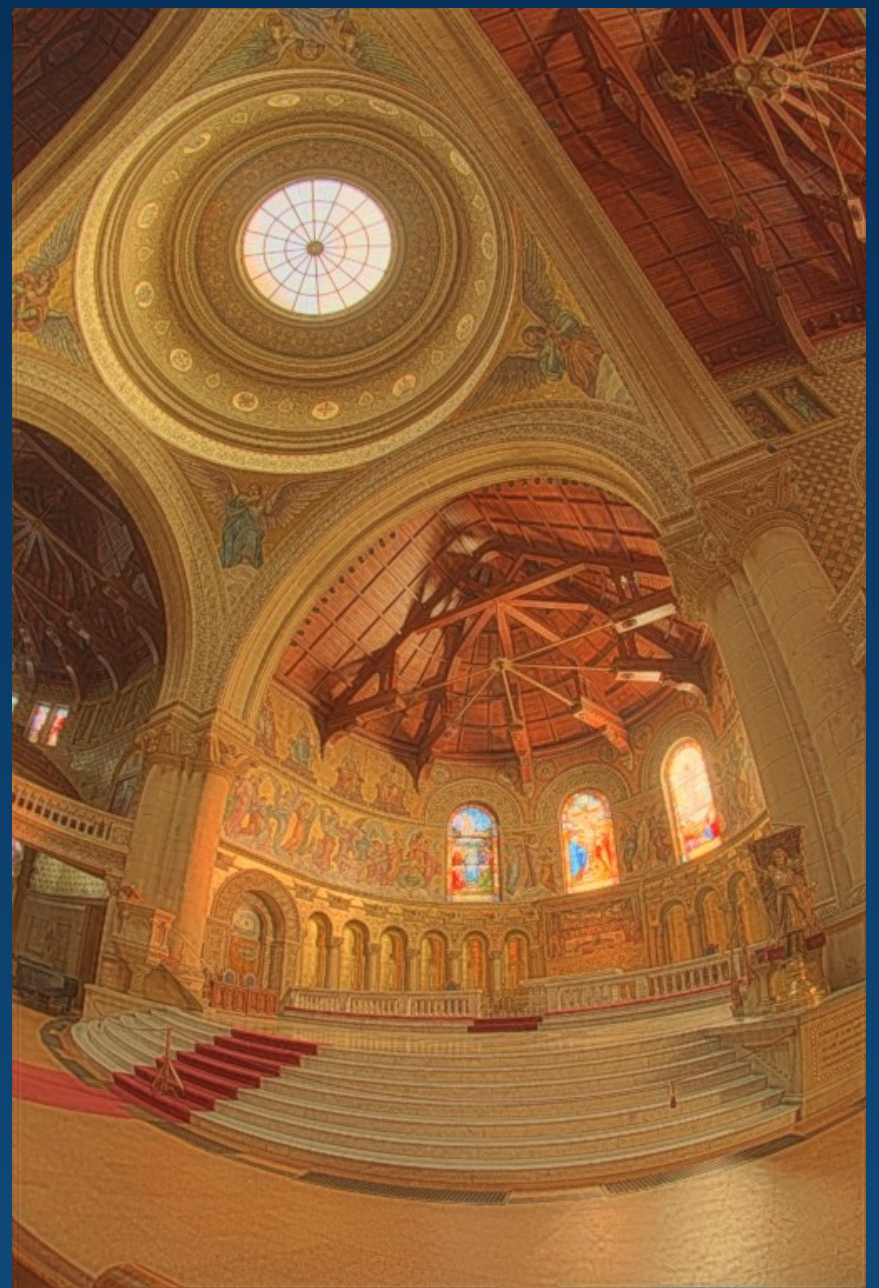

Results (our method)

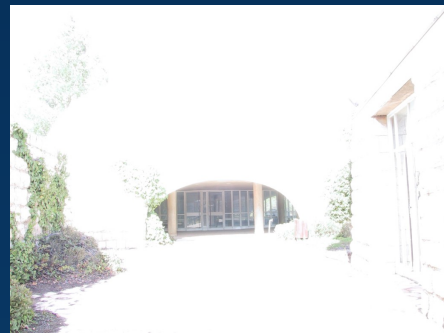

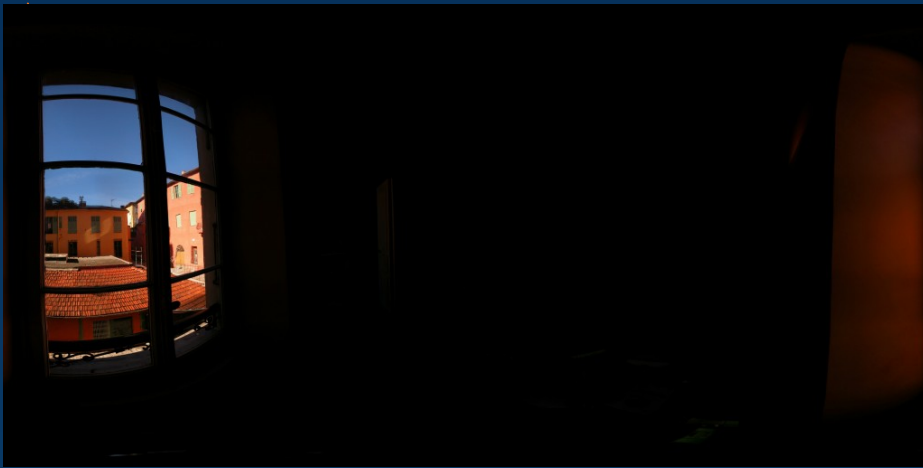

Our method (2.3 sec)

LCIS (4 min)

Summary

- New method for detail-preserving compression of dynamic range.
- Also useful for enhancing ordinary images.
- Future work:
 - Better handling of color
 - Incorporate psychophysical properties of the HVS
 - Explore other applications of gradient field manipulations.

Acknowledgments

- Thanks to: Paul Debevec, Max Lyons, Shree Nayar, Jack Tumblin, Greg Ward (and many others) for sharing their code and images.
- Work funded by the Israel Science Foundation founded by the Israel Academy of Sciences and Humanities.
